

CLOUD BUSINESS MANAGEMENT

Nebulas ERP

From first contact to payment. **Without losing the thread.**

Sales, purchasing, documents, e-invoicing, payments, inventory and projects — every step uses the same data, and every flow can follow the real rules of your business.

THE PROBLEM

Between quotation and payment, the thread breaks.

A quotation in a spreadsheet. An order in an email thread.
A delivery note typed again into another program. An
invoice in a separate e-invoicing portal. A payment
reconciled by hand.

Every hand-off between tools is a place where time disappears
and errors begin. The history of one sale ends up scattered across
five systems — and **nobody sees the whole picture**.

The same data should make the whole
journey — from first contact to payment.

Sound familiar?

- Documents retyped at every step
- E-invoicing handled outside the management system
- Inventory that doesn't match reality
- Due dates tracked in spreadsheets
- Customer history split across tools
- Numbers assembled by hand at month-end

Payment

One flow. The same data. Every step traceable.

One flow. The same data. Your rules.

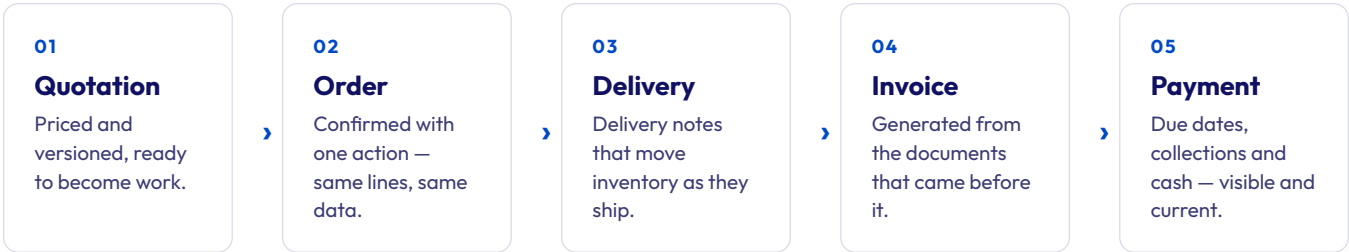

Nebulas ERP connects sales, purchasing, documents, e-invoicing, payments, inventory, analytics and projects in one connected flow. Each document is born from the previous one — nothing is retyped, everything stays traceable.

And because no two businesses work alike, flows follow the real rules of your company: your document types, your approval steps, your automations along order-to-cash and procure-to-pay.

Each document is born from the previous one. Nothing is retyped.

Order-to-cash and procure-to-pay, automated under your rules.

The document flow

One thread from first contact to payment — with purchasing running the same way on the supplier side.

What Nebulas ERP takes care of.

01

Sales and purchasing

Documents that move with the work.

Quotations, orders, delivery notes, invoices and supplier documents in one place — with automation along order-to-cash and procure-to-pay, so the routine steps run themselves.

02

Electronic invoicing

The Italian Sdl flow inside the ERP.

XML generation, sending, receiving and monitoring — for PA, B2B and B2C cases — with statuses and notifications integrated in the same flow as the documents themselves. No separate portal, no double entry.

03

Customers and relationships

Every business relationship, with its full history.

Fiscal data, commercial terms, contacts, communications by email and WhatsApp, and activity tracking — unified in one record, visible to the people who need it.

04

Inventory

Availability, movements and fulfilment in one picture.

Product catalogue, stock across multiple warehouses, automatic movements driven by documents, and replenishment ordering before shortages become delays.

05 Administration and analytics

Due dates, cash and performance made clear.

Payment tracking, operational accounting, cashbook management and configurable KPI dashboards — the financial side of the same flow, not a separate world.

06 Projects, automation and access control

The ERP also follows work that doesn't end with an invoice.

WBS, timesheets and Gantt timelines for jobs; automated rules and APIs for the repetitive steps; granular role-based permissions for control by module and operation.

The document flow in Nebulas ERP — invoices and credit notes with dates, amounts and e-invoicing status in one filterable view, with the live document preview below. Demo data.

Run it your way.

A

Shaped on your processes

We map your existing workflows first, then configure modules, permissions and integrations to match — and keep improving the setup with your team as the business evolves.

B

Connected beyond the ERP

E-commerce and external services, APIs and microservices, Google email, Drive and Calendar where enabled, import/export for everything else — the ERP joins your landscape instead of isolating it.

C

Security you can audit

Browser access from wherever the team works, two-factor authentication and session management, a login and user-event audit trail, and permissions granular by module and operation.

Start with one workflow

Begin with the flow that hurts most — quotations, e-invoicing, inventory — validate it in real work, then extend. **The platform grows module by module, not by big bang.**

Stronger inside the platform.

Nebulas ERP shares users, rules and data with the rest of the Nebulas platform — so the sale you manage here becomes a project, a schedule, a printed document and a number on the dashboard, without copies.

Nebulas Projects

Turn orders into jobs with WBS, timelines, boards and timesheets — project control connected to the same customers and documents.

Nebulas Calendar

Schedule people and resources around the work the ERP creates — with availability, slots and notifications that carry business context.

Nebulas Analytics

Read sales, profitability, cash and inventory from the ERP's own data — current, comparable, and in one dashboard.

Nebulas Cloud Printing

Send delivery notes, labels and invoices straight to the right local printer — with a verifiable printed-or-failed result.

And when standard isn't enough

Custom software, systems integration and managed cloud — one joined-up team, one point of contact, since 2001. The ERP can grow into whatever your processes need.

NEXT STEP

See your flow, end to end.

Tell us how a sale runs through your company today — we'll show you the same journey inside Nebulas ERP, under your rules.

Explore Nebulas ERP

Every capability, in detail.
